ASSIGNMENT-2: Accessing Global Variables

Task-1 : Write a function incrementGlobal() that uses and modifies a global variable counter.

- Define a global variable counter and take the input.
- Define the function incrementGlobal().
- Inside the function, increment the counter by 1 and return the new value.
- Print the result of incrementGlobal() and counter.

Sample input:

10

Sample output:

11

11

Explanation:

- The user inputs 10 as the initial value of the counter.
- The incrementGlobal() function increments counter by 1, resulting in 11.
- The function returns 11, which is printed.
- The global variable counter is now 11, confirming the update.
